Invitation to the Advanced Technologies Center
You are invited for a treatment session
On Tuesday, 23 FEB 2021, at 08:45 am

Our location: Hospitalization tower, ground floor next to the central operation theatre
Parking: central parking, you can enter "Central parking Sheba Hospital at Tel Hashomer" in WAZE.

Visit guidelines:

- You must arrive with a photo identification certificate (Israeli ID with attachment for a child/driver's license/passport).
- Please bring with you a payment commitment (form 17) from an insuring entity according to the exam codes detailed herein:

Exam code	Description
52204	Cystoscopy + a surgical procedure [HW] *1545*

Should you fail to bring the required payment commitment you will be able to obtain service either for a payment or by leaving a deposit (up to 1000 NIS) for 21 days.
The insurer has no obligation to pay for the service retrospectively

- Soldiers – please equip yourselves with a valid budgetary reference, no deposit or payment will be accepted.
- Please bring any previous medical documents and x-ray images if you have any.

Please note:

- You may arrive with only one accompanying person.
- You must arrive with a surgical mask and wear it at all times while you are staying at the hospital
- Please refrain from arriving if you are in home quarantine or if you suffer from one of the following symptoms: high fever over 38 degrees, cough, difficulty in breathing, sore throat, acute headache/muscle ache.
- Your stay time at the clinic/institute is approx. 3 hours. In order to shorten your stay please avoid arriving early.

For inquiries
If for some reason you are unable to arrive at the exam, we ask that notify us in advance. Call 03-5305275 on Sundays thru Thursdays 08:00 am to 03:00 pm, or by mail to mrt.office@sheba.gov.il
In addition, you may contact us on the chat application on our website at: www.sheba.co.il,
on WhatsApp to the number 03-5305000, by text message to 03-5303604 or on our Facebook page.

We wish you complete health,

Dept. Director: Dr. [redacted] **Tel: 03–5302239**
Charge nurse: Ms. [redacted] **Fax: 03 – 5351892**

Discharge Letter

[redacted], [redacted]
Address: [redacted]
Age: 74, male Admission no. [redacted] [redacted], Ramat Gan [redacted]
Hospitalization date: 07 FEB 2021 02:34 am

Actual discharge date

Discharge date: 10 FEB 2021

Current diagnosis

- **Ureteral stone – distal ureter** (Right) (592.1)

COVID-19 status

COVID-19 status: negative

Surgeries / Procedures performed in hospitalization
URETEROSCOPY & LASER LITHOTRIPSY 523370
56.31 (Right) 08/02/2021
CYSTOSCOPY AND URETERAL STENT INSERTION 523320
57.32 (Right) 08/02/2021

Current disease
74-yer-old male patient, infection in the presence of a stone 4*3.5 in the distal right ureter
74-yer-old male patient, infection in the presence of a stone 4*3.5 in the distal right ureter

In his background: diabetes, hypertension, dyslipidemia
Treated with Aspirin
Without a history of a stone disease (his son suffers from kidney stones)
Two days ago he started feeling spasmatic pain in the lower back and right hip
Pain was coming and going intermittently. In addition, he describes dysuria. Without visible hematuria
Without fever, but he had chills a few days ago.
Upon his admission, fever 36.8, pulse 60, blood pressure 81/124
Upon examination, abdomen soft, non-sensitive, minimal sensitivity in tapping on right hip. A catheter was inserted with excretion of clear urine.
Lab – 14.6 thousand leukocytes, without a left deviation, Hemoglobin 15, creatinine 4.84 (from a previous testing in July creatinine 3. According to him this is on a background of Metformin toxicity – he stopped taking the medication in view of this), potassium 5.6, amylase 181, lipase 175 – in consulting with the surgery on duty physician [redacted] – in view of the missing correct clinic and a more reasonable etiology of his pain than pancreatitis. Now we should only continue with lab follow up – we will take repeated tests tomorrow.

CRP 22
Urine stick – positive for protein, RBC
The right kidney is swollen, perinephric fat infiltration and a mild hydronephrosis are demonstrated .
NCCT – the right ureter is mildly enlarged and there is infiltration of fat along its length, this is due to a stone blocking the distal end measuring approx. 4 mm.
The left kidney is of normal size, without perinephric fat infiltration, without hydronephrosis .
The left ureter is not expanded. No stone was observed along its length.
The urine bladder is not in full distension but there is an impression of a diffused wall thickening with content within.

Was presented to the on-call urologist – [redacted] – at the present inpatient stay with a conservative treatment by antibiotics. Tomorrow we will consider a nephrostomy.

Plan –
Antibiotics
Hospitalization in Urology

Tomorrow lab testing including amylase and lipase

No known sensitivity to medications
No known sensitivity to substances

Surgery summary
08 FEB 2021 08:05 pm 08:05 pm
Underwent RT URS. A stone impacted measuring approx. 5 mm in the distal ureter, approx. 2 cm proximal to the calyx. It was crushed and pulled out. Was left with DJ 6F for two weeks.

Course and discussion
74-year-old, male with background as above

Was admitted with a picture of infection in the urinary tract in a presence of a stone in the right distal ureter, with a rise in creatinine up to 5 from a baseline of 3.
During his inpatient stay he was treated with antibiotics with clinical and laboratory improvement at first, this was followed by an exacerbation in creatinine up to 5 again. Therefore, on 08 FEB 2021 he, under general anesthesia and in a normal course, underwent a ureteroscopy on the right and laser crashing of an impacted stone measuring approx. 5 mm in the distal ureter, approx. 2 cm proximal to the calyx. It was crushed and pulled out. Was left with DJ 6F for two weeks.
Course of hospitalization following the procedure was normal. A urethral and ureteral catheters were left in, that were removed on day 2 after the procedure.

Recommendation upon discharge

Recommendation:	Continue follow up with the attending physician and regular medication therapy. For pain - optalgin in drops/paracetamol tablet 1 gr. Up to three times a day as needed. Removal of the stent at the Advanced Technologies Center in two weeks. Please set an appointment at 03-5305275. In case of a rise in fever above 38.3oC, in case of urine retention or the appearance of pain in the hip or abdomen that do not respond to painkillers – come back to the Urgent Care Department
Sick leave:	2 weeks.

To set an appointment at the Urology Institute please call: 03-5302159

Name of the senior physician in charge of discharge from the hospital
Physician: [redacted]

Letter is signed by: Dr. [redacted] MD Licenses no.: [redacted]
